

Employee Attrition Analysis – Summary of Findings

About the Dataset

- Total employees analysed: **1,470**
- Objective: Identify the key reasons why employees leave the company and provide practical recommendations to improve employee retention.

• Key Findings

→ Our analysis shows that employee attrition is not caused by a single factor but by a combination of salary, work experience, and work-life balance. Employees with lower monthly income were more likely to leave the company than employees with higher salaries. Similarly, employees who had spent fewer years at the company showed a greater tendency to resign, suggesting that the early years of employment are the most critical for retention.

→ Among all departments, the **Sales department** experienced the highest employee attrition rate (**20.63%**), while **Sales Representatives** had the highest attrition among all job roles (**39.76%**). These groups should therefore receive the highest priority in future retention efforts.

→ Although salary has a noticeable impact on employee turnover, it is not the only reason employees leave. Employees who reported slightly lower work-life balance were also more likely to resign, indicating that employee satisfaction and workplace experience play an important role alongside compensation.

• Recommendations

→ Based on these findings, HR should focus on improving retention during the first few years of employment through structured onboarding, career development plans, mentoring programs, and regular one-on-one discussions. Special attention should be given to employees working in Sales-related roles, where attrition is significantly higher than other departments.

→ The company should also review compensation for lower-paid employees while simultaneously improving work-life balance through flexible work arrangements, wellness initiatives, and better employee engagement programs. Addressing both financial and workplace factors together is likely to produce better retention outcomes than focusing on salary alone.

• Conclusion

→ This analysis provides useful insights into employee attrition and can help HR identify groups of employees who may require additional support. However, the results should be used as a decision-support tool rather than the sole basis for HR decisions, since personal circumstances and future organizational changes cannot be fully captured by historical employee data.
